## Portfolio Description

The DFA International Value Portfolio is a disciplined and broadly diversified vehicle designed to capture the risk factors research has shown generate higher expected returns over time. Dimensional employs an investment process that focuses on capturing these premiums in ways that minimize turnover and trading costs, manage market frictions and mitigate the adverse effects of momentum through flexible and patient trading. The portfolio invests in large non-US developed market equity securities assessed by market capitalization within each market. Value screens are also applied to focus the portfolio on deeper value stocks as measured primarily by book-to-market ratio. All potential holdings pass through additional rigorous screens to place more emphasis on the desired asset class and to exclude securities that present a potential drag on performance.

## Performance Commentary

### Market Overview

In US dollar terms, developed ex US markets had weak aggregate returns in the first quarter, trailing the US market by about 0.9%. Using the MSCI World ex USA IMI Index and its sector and country segments as proxies, non-US developed markets gained +1.1%.

As in most of the previous quarters, dispersion at the individual country level remained high and increased from the previous quarter. For instance, the difference between the best-performing developed market, Italy (+15.0%), and the worst-performing one, Japan (-5.1%), was over 20%. The US dollar depreciated against the Australian dollar, the New Zealand dollar, and the Japanese yen, but appreciated against the Canadian dollar. Overall, currency fluctuations had a positive impact on the US dollar-denominated returns of developed non-US equities. Utilities and health care were the best-performing sectors, while telecommunication services and consumer discretionary were the weakest.

### Premium Discussion

Along the market capitalization dimension, small caps (MSCI World ex USA Small Cap) outperformed large caps (MSCI World ex USA Large Cap) by 3.1% for the quarter.

Along the relative price dimension, low relative price stocks (value stocks) outperformed high relative price (growth stocks) among both large and small caps. Using the MSCI World ex USA Index and its sector and country segments as proxies, large value stocks (MSCI World ex USA Large Cap Value) outperformed large growth stocks (MSCI World ex USA Large Cap Growth) by 1.1%, and small value stocks (MSCI World ex USA Small Cap Value) outperformed small growth stocks (MSCI World ex USA Small Cap Growth) by 1.1%.

### Attribution Description

Detailed attribution for your particular strategy can be found in the charts on the preceding pages. These tables contrast the portfolios exposure to various factors (e.g., size, value, profitability, sector, region, or country) against a stated benchmark. Attribution by Size is broken down in to market cap ranges i.e., the largest stocks are included in the top bucket and the smallest names are captured in the bottom bucket. Attribution by Price-to-Book (value vs. growth) breaks its observations down into distinct segments and includes growth-oriented stocks (highest P/B) in the top bucket and value stocks (lowest P/B) in the bottom bucket. Similarly, Attribution by Direct Profitability-to-Book breaks its observations down into distinct segments and includes low direct profitability stocks in the top bucket and high direct profitability stocks in the bottom bucket. The Attribution by Sector table breaks down the portfolio performance relative to the benchmark by sector, as defined by GICS (with the exception of REITs). Finally, attributions are broken down by region and individual emerging market country exposure.

**Portfolio:**  
Intl. Value Portfolio (I) vs. MSCI World ex USA Index (net div.)

## Attribution Definition

**Portfolio Allocation:** Measures the weighting differences between the portfolio and benchmark amongst the different buckets. Generally speaking, if the portfolio has greater (lesser) weight in a particular bucket than the benchmark and that segment for the benchmark outperforms the overall benchmark return, there will be positive (negative) attribution.

**Portfolio Composition:** Measures the underlying returns based on the composition of the assets held within each segment of the attribution chart. If, for example, the benchmark and portfolio weights in a particular size quintile were identical, but the underlying composition of the stocks held within that bucket was different, there would be different return results. More generally, if the portfolio's composition of securities within a particular bucket results in higher (lower) returns than the benchmark's composition, attribution results for that bucket would be positive (negative).

**Interaction component:** This component of attribution arises because returns compound the wealth in a portfolio grows multiplicatively, not additively. Thus, a difference between the portfolio and benchmark returns in one period causes a difference in their dollar growth their growth of wealth in all future periods. The Interaction Component captures this compounding effect which occurs over multiple time periods. Over more volatile periods, this number can at times be inflated.

**Additional Notes:** From time to time strategy attributions may appear to have inconsistent results. Some causes for potential divergence include:

-When the portfolio or benchmark has a very small allocation to a bucket and the return of the holding(s) in that bucket is extreme (e.g. if the index has a 1% allocation to a bucket with a 102% return and the portfolio has a 10% allocation and a 10% return), the allocation and composition contributions in this situation can become exaggerated.

-The return of the benchmark may not be indicative of the actual return because there is no weight (or only a few names). For example, in DFA's international small cap portfolio compared to the MSCI EAFE small cap benchmark, the portfolio invests in Canada while the benchmark does not. Therefore, the benchmark attribution components would utilize a 0% weight and a null return for Canada which would most likely lead to misleading results.

-Since attributions are computed on a month over month basis, during periods of extreme volatility, attribution results may be inconsistent with the average weights and returns shown in the buckets. The linked tables may in some cases show opposite contributions to what one would expect from the overall weights and returns allocation.

-'Other' Category: The 'Other' category at the bottom of the attribution charts can at times be larger than expected as it constitutes various items including differences owing to timing of foreign exchange rates, pricing methodology, trading, turnover, and other items.
